Effect of Prosthetic Foot-type and Walking Velocity on Vertical Ground Reaction Forces in Individuals with Transtibial Amputations

Smita Rao, H. John Yack P.T., Ph.D., Miao-Ju Hsu, Ruchika Chandran, David Nielsen P.T., Ph.D.
Graduate Program in Physical Therapy and Rehabilitation Science, The University of Iowa
Effect of Prosthetic foot design:

1. Effect of prosthetic foot design on loading characteristics of the involved limb
2. Effect of prosthetic foot design on loading characteristics of the sound limb
3. Differential loading of the sound and involved limb
Effect of Walking Velocity:

1. Walking velocity influences peak forces and loading rates
2. Most studies done at ‘self-selected walking velocity’
3. Wide variation:
   - SACH: 66.9 - 90.2 m/min (2.50 - 2.60 mph)
   - Flexfoot: 69.3 - 102 m/min (3.38 - 3.82 mph)
4. Walking velocity as a confounding factor
Purpose:

- To examine the effect of prosthetic foot type on vertical ground reaction forces characteristics, in the sound and the involved limb in individuals with transtibial amputation while controlling for walking velocity.
Subjects:

• 8 male subjects
• Nonvascular unilateral transtibial amputation
• Duration since amputation: at least 1 year

</tbody>
</table>
Methods:

- 3 different prosthetic feet: SACH, OttoBock C-walk, Flexfoot
- Attached to the same socket, aligned by the same clinician
- 1 month to accommodate
- 3 testing sessions
Data Acquisition:

- 30 second trial in the 4th minute of walking
- Sampling rate of 50 Hz
- Averaged over 15 strides
Results:

- Self Selected walking velocity
